1 Setup

1.0.1 Tips Test session: Check `__int128` and GNU builtins.

C++ var. limits: int -2^{31}, $2^{31}-1$

ll -2^{63}, $2^{63}-1$

ull 0, $2^{64}-1$

`__int128` -2^{127}, $2^{127}-1$

ld $-1.7e308$, $1.7e308$, 18 digits precision

1.0.2 header.h

```cpp
#pragma once
#include <bits/stdc++.h>
using namespace std;

#define ll long long
#define ull unsigned ll
#define ld long double
#define pl pair<ll, ll>
#define pi pair<int, int>
#define vl vector<ll>
#define vi vector<int>
#define vb vector<bool>
#define vvi vector<vi>
#define vvl vector<vl>
#define vpl vector<pl>
#define vpi vector<pi>
#define vld vector<ld>
#define vvpi vector<vpi>
#define in(el, cont) (cont.find(el) != cont.end()
    )// sets/maps
#define all(x) x.begin(), x.end()

constexpr int INF  = 2000000010;
constexpr ll LLINF = 9000000000000000010LL;

// int main() {
//   ios::sync_with_stdio(false);  // do not use
    cout + printf
//   cin.tie(NULL);
//   cout << fixed << setprecision(12);
//   return 0;
// }
```

1.0.3 Aux. helper C++

```cpp
#include "header.h"
int main() {
    // Read in a line including white space
    string line;
    getline(cin, line);
    // When doing the above read numbers as
        follows:
    int n;
    getline(cin, line);
    stringstream ss(line);
    ss >> n;

    // Count the number of 1s in binary
        represnatation of a number
    ull number;
    __builtin_popcountll(number);
}

// __int128
using lll = __int128;
ostream& operator<<( ostream& o, __int128 n ) {
    auto t = n<0 ? -n : n; char b[128], *d = end(b)
        ;
    do *--d = '0'+t%10, t /= 10; while (t);
    if(n<0) *--d = '-';
    o.rdbuf()->sputn(d,end(b)-d);
    return o;
}
```

1.0.4 Aux. helper python

```python
from functools import lru_cache

# Read until EOF
while True:
    try:
        pattern = input()
    except EOFError:
        break

@lru_cache(maxsize=None)
def smth_memoi(i, j, s):
    # Example in-built cache
    return "sol"

# Fast I
import io, os
def fast_io():
    finput = io.BytesIO(os.read(0,
        os.fstat(0).st_size)).readline
    s = finput().decode()
    return s

# Fast O
import sys
def fast_out():
    n = 5
    sys.stdout.write(str(n)+"\n")
```

2 Python

2.1 Graphs

2.1.1 BFS

```python
from collections import deque
def bfs(g, roots, n):
    q = deque(roots)
    explored = set()
    distances = [0 if v in roots else float('inf'
        ) for v in range(n)]
    while len(q) != 0:
        node = q.popleft()
        if node in explored: continue
        explored.add(node)
        for neigh in g[node]:
            if neigh not in explored:
                q.append(neigh)
                distances[neigh] = distances[node
                    ] + 1
    return distances
```

2.1.2 Dijkstra

```python
from heapq import *
def dijkstra(n, root, g):  # g = {node: (cost,
    neigh)}
    dist = [float("inf")]*n
    dist[root] = 0
    prev = [-1]*n

    pq = [(0, root)]
    heapify(pq)
    visited = set([])

    while len(pq) != 0:
        _, node = heappop(pq)

        if node in visited: continue
        visited.add(node)

        # In case of disconnected graphs
        if node not in g:
            continue

        for cost, neigh in g[node]:
            alt = dist[node] + cost
            if alt < dist[neigh]:
                dist[neigh] = alt
                prev[neigh] = node
                heappush(pq, (alt, neigh))
    return dist
```

2.1.3 **Topological Sort** topological sorting of a DAG

```python
from collections import defaultdict
class Graph:
    def __init__(self,vertices):
        self.graph = defaultdict(list) #adjacency
            List
        self.V = vertices #No. V

    def addEdge(self,u,v):
        self.graph[u].append(v)

    def topologicalSortUtil(self,v,visited,stack)
        :
        visited[v] = True
        # Recur for all the vertices adjacent to
            this vertex
        for i in self.graph[v]:
            if visited[i] == False:
                self.topologicalSortUtil(i,
                    visited,stack)
        stack.insert(0,v)

    def topologicalSort(self):
        visited = [False]*self.V
        stack =[]
        for i in range(self.V):
            if visited[i] == False:
                self.topologicalSortUtil(i,
                    visited,stack)
        return stack

    def isCyclicUtil(self, v, visited, recStack):
        visited[v] = True
        recStack[v] = True
        for neighbour in self.graph[v]:
            if visited[neighbour] == False:
                if self.isCyclicUtil(neighbour,
                    visited, recStack) == True:
                    return True
            elif recStack[neighbour] == True:
                return True
        recStack[v] = False
        return False

    def isCyclic(self):
        visited = [False] * (self.V + 1)
        recStack = [False] * (self.V + 1)
        for node in range(self.V):
            if visited[node] == False:
                if self.isCyclicUtil(node,
                    visited, recStack) == True:
                    return True
        return False
```

2.1.4 **Kruskal (UnionFind)** Min. span. tree

```python
class UnionFind:
    def __init__(self, n):
        self.parent = [-1]*n

    def find(self, x):
        if self.parent[x] < 0:
            return x
        self.parent[x] = self.find(self.parent[x
            ])
        return self.parent[x]

    def connect(self, a, b):
        ra = self.find(a)
        rb = self.find(b)
        if ra == rb:
            return False
        if self.parent[ra] > self.parent[rb]:
            self.parent[rb] += self.parent[ra]
            self.parent[ra] = rb
        else:
            self.parent[ra] += self.parent[rb]
            self.parent[rb] = ra
        return True

# Full MST is len(spanning==n-1)
def kruskal(n, edges):
    uf = UnionFind(n)
    spanning = []
    edges.sort(key = lambda d: -d[2])
    while edges and len(spanning) < n-1:
        u, v, w = edges.pop()
        if not uf.connect(u, v):
            continue
        spanning.append((u, v, w))
    return spanning
```

2.1.5 **Prim** Min. span. tree - good for dense graphs

```python
from heapq import heappush, heappop, heapify
def prim(G, n):
    s = next(iter(G.keys()))
    V = set([s])
    M = []
    c = 0

    E = [(w,s,v) for v,w in G[s].items()]
    heapify(E)

    while E and len(M) < n-1:
      w,u,v = heappop(E)
      if v in V: continue
      V.add(v)
      M.append((u,v))
      c += w
      u = v
      [heappush(E,(w,u,v)) for v,w in G[u].items()
          if v not in V]

    if len(M) == n-1:
      return M, c
    else:
      return None, None
```

2.2 Num. Th. / Comb.

2.2.1 **nCk % prime** p must be prime and k < p

```python
def fermat_binom(n, k, p):
    if k > n:
        return 0
    num = 1
    for i in range(n-k+1, n+1):
        num *= i % p
    num %= p
    denom = 1
    for i in range(1,k+1):
        denom *= i % p
    denom %= p
    # numerator * denominator^(p-2) (mod p)
    return (num * pow(denom, p-2, p)) % p
```

2.2.2 **Sieve of E.** $O(n)$ so actually faster than C++ version, but more memory

```python
MAX_SIZE = 10**8+1
isprime = [True] * MAX_SIZE
prime = []
SPF = [None] * (MAX_SIZE)
def manipulated_seive(N):  # Up to N (not
    included)
  isprime[0] = isprime[1] = False
  for i in range(2, N):
    if isprime[i] == True:
      prime.append(i)
      SPF[i] = i
    j = 0
    while (j < len(prime) and
    i * prime[j] < N and
      prime[j] <= SPF[i]):
      isprime[i * prime[j]] = False
      SPF[i * prime[j]] = prime[j]
      j += 1
```

2.2.3 Modular Inverse of a mod b

```python
def modinv(a, b):
  if b == 1: return 1
  b0, x0, x1 = b, 0, 1
  while a > 1:
    q, a, b = a//b, b, a%b
    x0, x1 = x1 - q * x0, x0
  if x1 < 0: x1 += b0
  return x1
```

2.2.4 Chinese rem. an x such that ∀ y,m: yx = 1 mod m requires all m,m' to be ¿=1 and coprime

```python
def chinese_remainder(ys, ms):
  N, x = 1, 0
  for m in ms: N*=m
  for y,m in zip(ys,ms):
    n = N // m
    x += n * y * modinv(n, m)
  return x % N
```

2.2.5 Bezout

```python
def bezout_id(a, b):
  r,x,s,y,t,z = b,a,0,1,1,0
  while r:
    q = x // r
    x, r = r, x % r
    y, s = s, y - q * s
    z, t = t, z - q * t
  return y % (b // x), z % (-a // x)
```

2.2.6 Gen. chinese rem.

```python
def general_chinese_remainder(a,b,m,n):
  g = gcd(m,n)

  if a == b and m == n:
    return a, m
  if (a % g) != (b % g):
    return None, None

  u,v = bezout_id(m,n)
  x = (a*v*n + b*u*m) // g
  return int(x) % lcm(m,n), int(lcm(m,n))
```

2.3 Strings

2.3.1 Longest common substr. (Consecutive) $O(mn)$ time, $O(m)$ space

```python
from functools import lru_cache
@lru_cache
def lcs(s1, s2):
    if len(s1) == 0 or len(s2) == 0:
        return 0
    return max(
      lcs(s1[:-1], s2), lcs(s1, s2[:-1]),
      (s1[-1] == s2[-1]) + lcs(s1[:-1], s2[:-1])
    )
```

2.3.2 Longest common subseq. (Non-consecutive)

```python
def longestCommonSubsequence(text1, text2):
    n = len(text1)
    m = len(text2)
    prev = [0] * (m + 1)
    cur = [0] * (m + 1)
    for idx1 in range(1, n + 1):
        for idx2 in range(1, m + 1):
            # matching
            if text1[idx1 - 1] == text2[idx2 -
                1]:
                cur[idx2] = 1 + prev[idx2 - 1]
            else:
                # not matching
                cur[idx2] = max(cur[idx2 - 1],
                    prev[idx2])
        prev = cur.copy()
    return cur[m]
```

2.3.3 KMP Return all matching pos. of P in T

```python
class KMP:
    def partial(self, pattern):
        """ Calc. partial match table: String ->
            [Int]"""
        ret = [0]
        for i in range(1, len(pattern)):
            j = ret[i - 1]
            while j > 0 and pattern[j] != pattern
                [i]: j = ret[j - 1]
            ret.append(j + 1 if pattern[j] ==
                pattern[i] else j)
        return ret

    def search(self, T, P):
        """KMPString -> String -> [Int]"""
        partial, ret, j = self.partial(P), [], 0
        for i in range(len(T)):
            while j > 0 and T[i] != P[j]: j =
                partial[j - 1]
            if T[i] == P[j]: j += 1
            if j == len(P):
                ret.append(i - (j - 1))
                j = partial[j - 1]
        return ret
```

2.3.4 Suffix Array

```python
class Entry:
    def __init__(self, pos, nr):
        self.p = pos
        self.nr = nr

    def __lt__(self, other):
        return self.nr < other.nr
class SA:
    def __init__(self, s):
        self.P = []
        self.n = len(s)
        self.build(s)

    def build(self, s): # n log log n
        n = self.n
        L = [Entry(0, 0) for _ in range(n)]
        self.P = []
        self.P.append([ord(c) for c in s])
        step = 1
        count = 1

        # self.P[step][i] stores the position
        # of the i-th longest suffix
        # if suffixes are sorted according to
        # their first 2^step characters.
        while count < 2 * n:
            self.P.append([0] * n)
            for i in range(n):
                nr = (self.P[step - 1][i],
                    self.P[step - 1][i +
                        count]
                    if i + count < n else -1)
                L[i].p = i
                L[i].nr = nr
            L.sort()
            for i in range(n):
                if i > 0 and L[i].nr == L[i -
                    1].nr:
                    self.P[step][L[i].p] = \
                        self.P[step][L[i - 1].p]
                else:
                    self.P[step][L[i].p] = i
            step += 1
```

```
42          count *= 2
43
44      self.sa = [0] * n
45      for i in range(n):
46          self.sa[self.P[-1][i]] = i
```

2.3.5 Longest common pref. with the suffix array built we can do, e.g., longest common prefix of x, y with suffixarray where x,y are suffixes of the string used $O(\log n)$

```
1 def lcp(x, y, P):
2     res = 0
3     if x == y:
4         return n - x
5     for k in range(len(P) - 1, -1, -1):
6         if x >= n or y >= n:
7             break
8         if P[k][x] == P[k][y]:
9             x += 1 << k
10            y += 1 << k
11            res += 1 << k
12    return res
```

2.3.6 Edit distance

```
1 def editDistance(str1, str2):
2   m = len(str1)
3   n = len(str2)
4   curr = [0] * (n + 1)
5   for j in range(n + 1):
6     curr[j] = j
7   previous = 0
8   # dp rows
9   for i in range(1, m + 1):
10    previous = curr[0]
11    curr[0] = i
12
13    # dp cols
14    for j in range(1, n + 1):
15      temp = curr[j]
16      if str1[i - 1] == str2[j - 1]:
17        curr[j] = previous
18      else:
19        curr[j] = 1 + min(previous, curr[j - 1],
                curr[j])
20      previous = temp
21   return curr[n]
```

2.3.7 Bitstring Slower than a set for many elements, but hashable

```
1 def add_element(bit_string, index):
2     return bit_string | (1 << index)
3 def remove_element(bit_string, index):
4     return bit_string & ~(1 << index)
5 def contains_element(bit_string, index):
6     return (bit_string & (1 << index)) != 0
```

2.4 Geometry

2.4.1 Convex Hull

```
1 def vec(a,b):
2     return (b[0]-a[0],b[1]-a[1])
3 def det(a,b):
4     return a[0]*b[1] - b[0]*a[1]
5 def convexhull(P):
6     if (len(P) == 1):
7         return [(p[0][0], p[0][1])]
8
9     h = sorted(P)
10    lower = []
11    i = 0
12    while i < len(h):
13        if len(lower) > 1:
14            a = vec(lower[-2], lower[-1])
15            b = vec(lower[-1], h[i])
16            if det(a,b) <= 0 and len(lower) > 1:
17                lower.pop()
18                continue
19        lower.append(h[i])
20        i += 1
21
22    upper = []
23    i = 0
24    while i < len(h):
25        if len(upper) > 1:
26            a = vec(upper[-2], upper[-1])
27            b = vec(upper[-1], h[i])
28            if det(a,b) >= 0:
29                upper.pop()
30                continue
31        upper.append(h[i])
32        i += 1
33
34    reversedupper = list(reversed(upper[1:-1:]))
35    reversedupper.extend(lower)
36    return reversedupper
```

2.4.2 Geometry

```
1
2 def vec(a,b):
3     return (b[0]-a[0],b[1]-a[1])
4
5 def det(a,b):
6     return a[0]*b[1] - b[0]*a[1]
7
8     lower = []
9     i = 0
10    while i < len(h):
11        if len(lower) > 1:

```

3 C++

3.1 Graphs

3.1.1 BFS

```cpp
1  #include "header.h"
2  #define graph unordered_map<ll, unordered_set<ll
       >>
3  vi bfs(int n, graph& g, vi& roots) {
4      vi parents(n+1, -1); // nodes are 1..n
5      unordered_set<int> visited;
6      queue<int> q;
7      for (auto x: roots) {
8          q.emplace(x);
9          visited.insert(x);
10     }
11     while (not q.empty()) {
12         int node = q.front();
13         q.pop();
14
15         for (auto neigh: g[node]) {
16             if (not in(neigh, visited)) {
17                 parents[neigh] = node;
18                 q.emplace(neigh);
19                 visited.insert(neigh);
20             }
```

```cpp
21         }
22     }
23     return parents;
24 }
25 vi reconstruct_path(vi parents, int start, int
       goal) {
26     vi path;
27     int curr = goal;
28     while (curr != start) {
29         path.push_back(curr);
30         if (parents[curr] == -1) return vi(); //
               No path, empty vi
31         curr = parents[curr];
32     }
33     path.push_back(start);
34     reverse(path.begin(), path.end());
35     return path;
36 }
```

3.1.2 DFS Cycle detection / removal

```cpp
1  #include "header.h"
2  void removeCyc(ll node, unordered_map<ll, vector<
       pair<ll, ll>>>& neighs, vector<bool>& visited
       ,
3  vector<bool>& recStack, vector<ll>& ans) {
4      if (!visited[node]) {
5          visited[node] = true;

7          auto it = neighs.find(node);
8          if (it != neighs.end()) {
9              for (auto util: it->second) {
10                 ll nnode = util.first;
11                 if (recStack[nnode]) {
12                     ans.push_back(util.second);
13                 } else if (!visited[nnode]) {
14                     removeCyc(nnode, neighs,
                           visited, recStack, ans);
15                 }
16             }
17         }
18     }
19     recStack[node] = false;
20 }
```

3.1.3 Dijkstra

```cpp
1  #include "header.h"
2  vector<int> dijkstra(int n, int root, map<int,
       vector<pair<int, int>>>& g) {
3      unordered_set<int> visited;
4      vector<int> dist(n, INF);
5      priority_queue<pair<int, int>> pq;
```

```cpp
6      dist[root] = 0;
7      pq.push({0, root});
8      while (!pq.empty()) {
9          int node = pq.top().second;
10         int d = -pq.top().first;
11         pq.pop();
12
13         if (in(node, visited)) continue;
14         visited.insert(node);
15
16         for (auto e : g[node]) {
17             int neigh = e.first;
18             int cost = e.second;
19             if (dist[neigh] > dist[node] + cost)
                   {
20                 dist[neigh] = dist[node] + cost;
21                 pq.push({-dist[neigh], neigh});
22             }
23         }
24     }
25     return dist;
26 }
```

3.1.4 Floyd-Warshall

```cpp
1  #include "header.h"
2  // g[i][j] = infty if not path from i to j
3  // if g[i][i] < 0, i is contained in a negative
       cycle
4  void warshall(vvl& g) {
5      for (int k=0; k<g.size(); ++k) {
6          for (int i=0; i<g.size(); ++i) {
7              for (int j=0; j<g.size(); ++j) {
8                  if (g[i][k] < LLONG_MAX and g[k][
                       j] < LLONG_MAX and g[i][j] >
                       g[i][k] + g[k][j]) {
9                      g[i][j] = g[i][k] + g[k][j];
10 }}}}}
```

3.1.5 Kruskal Minimum spanning tree of undirected weighted graph. $O(E \log E)$

```cpp
1  #include "header.h"
2  #include "disjoint_set.h"
3  pair<set<pair<ll, ll>>, ll>  kruskal(vector<tuple
       <ll, ll, ll>>& edges, ll n) {
4      set<pair<ll, ll>> ans;
5      ll cost = 0;
6
7      sort(edges.begin(), edges.end());
8      DisjointSet<ll> fs(n);
9
10     ll dist, i, j;
```

```cpp
11      for (auto edge: edges) {
12          dist = get<0>(edge);
13          i = get<1>(edge);
14          j = get<2>(edge);
15
16          if (fs.find_set(i) != fs.find_set(j)) {
17              fs.union_sets(i, j);
18              ans.insert({i, j});
19              cost += dist;
20          }
21      }
22      return pair<set<pair<ll, ll>>, ll> {ans, cost
          };
23 }
```

3.1.6 Hungarian algorithm Given J jobs and W workers (J <= W), computes the minimum cost to assign each prefix of jobs to distinct workers.

```cpp
1 #include "header.h"
2 template <class T> bool ckmin(T &a, const T &b) {
      return b < a ? a = b, 1 : 0; }
3 /**
4  * @tparam T: type large enough to represent
      integers of O(J * max(|C|))
5  * @param C: JxW matrix such that C[j][w] = cost
      to assign j-th
6  * job to w-th worker (possibly negative)
7  * @return a vector (length J), with the j-th
      entry = min. cost
8  * to assign the first (j+1) jobs to distinct
      workers
9  */
10 template <class T> vector<T> hungarian(const
      vector<vector<T>> &C) {
11   const int J = (int)size(C), W = (int)size(C
      [0]);
12   assert(J <= W);

```

```cpp
17     rep(it,0,60) { // while (h - l > 1e-8)
18       double m = (l + h) / 2, f = p(m);
19       if ((f <= 0) ^ sign) l = m;
20       else h = m;
21     }
22     ret.push_back((l + h) / 2);
23   }
24 }
25 return ret;
26 }
```

3.3.4 Golden Section Search
Finds the argument minimizing the function f in the interval $[a, b]$ assuming f is unimodal on the interval, i.e. has only one local minimum and no local maximum. The maximum error in the result is *eps*. Works equally well for maximization with a small change in the code. See TernarySearch.h in the Various chapter for a discrete version. $O(\log((b-a)/\epsilon))$

```cpp
1  /** Usage:
2   double func(double x) { return 4+x+.3*x*x; }
3   double xmin = gss(-1000,1000,func); */
4  #include "template.cpp"
5  // It is important for r to be precise, otherwise
       we don't necessarily maintain the inequality
       a < x1 < x2 < b.
6  double gss(double a, double b, double (*f)(double
       )) {
7    double r = (sqrt(5)-1)/2, eps = 1e-7;
8    double x1 = b - r*(b-a), x2 = a + r*(b-a);
9    double f1 = f(x1), f2 = f(x2);
10   while (b-a > eps)
11     if (f1 < f2) { //change to > to find maximum
12       b = x2; x2 = x1; f2 = f1;
13       x1 = b - r*(b-a); f1 = f(x1);
14     } else {
15       a = x1; x1 = x2; f1 = f2;
16       x2 = a + r*(b-a); f2 = f(x2);
17     }
18   return a;
19 }
```

3.3.5 Hill Climbing
Poor man's optimization for unimodal functions.

```cpp
1  #include "template.cpp"
2  typedef array<double, 2> P;
3  template<class F> pair<double, P> hillClimb(P
       start, F f) {
4    pair<double, P> cur(f(start), start);
5    for (double jmp = 1e9; jmp > 1e-20; jmp /= 2) {
```

```
6    rep(j,0,100) rep(dx,-1,2) rep(dy,-1,2) {
7      P p = cur.second;
8      p[0] += dx*jmp;
9      p[1] += dy*jmp;
10     cur = min(cur, make_pair(f(p), p));
11   }
12 }
13 return cur;
14 }
```

3.3.6 Integration Simple integration of a function over an interval using Simpson's rule. The error should be proportional to h^4, although in practice you will want to verify that the result is stable to desired precision when epsilon changes.

```
1 #include "template.cpp"
2 template<class F>
3 double quad(double a, double b, F f, const int n
     = 1000) {
4   double h = (b - a) / 2 / n, v = f(a) + f(b);
5   rep(i,1,n*2)
6     v += f(a + i*h) * (i&1 ? 4 : 2);
7   return v * h / 3;
8 }
```

3.3.7 Integration Adaptive Fast integration using an adaptive Simpson's rule.

```
1  /** Usage:
2  double sphereVolume = quad(-1, 1, [](double x) {
3  return quad(-1, 1, [\&](double y) {
4  return quad(-1, 1, [\&](double z) {
5  return x*x + y*y + z*z < 1; });});}); */
6  #include "template.cpp"
7  typedef double d;
8  #define S(a,b) (f(a) + 4*f((a+b) / 2) + f(b)) * (
      b-a) / 6
9  template <class F>
10 d rec(F& f, d a, d b, d eps, d S) {
11   d c = (a + b) / 2;
12   d S1 = S(a, c), S2 = S(c, b), T = S1 + S2;
13   if (abs(T - S) <= 15 * eps || b - a < 1e-10)
14     return T + (T - S) / 15;
15   return rec(f, a, c, eps / 2, S1) + rec(f, c, b,
        eps / 2, S2);
16 }
17 template<class F>
18 d quad(d a, d b, F f, d eps = 1e-8) {
19   return rec(f, a, b, eps, S(a, b));
20 }
```

3.4 Num. Th. / Comb.

3.4.1 Basic stuff

```

25
26       // sorted order is violated (fix)
27       while (rem_val > p[k]) {
28           p[k + 1] = p[k];
29           rem_val = rem_val - p[k];
30           k++;
31       }
32
33       p[k + 1] = rem_val;
34       k++;
35   }
36 }
```

3.7.11 Ternary search Find the smallest i in $[a,b]$ that maximizes $f(i)$, assuming that $f(a) < \cdots < f(i) \geq \cdots \geq f(b)$. To reverse which of the sides allows non-strict inequalities, change the $<$ marked with (A) to $<=$, and reverse the loop at (B). To minimize f, change it to $>$, also at (B). $O(\log(b-a))$

```
1 // Usage: int ind = ternSearch(0,n-1,[\&](int i){
      return a[i];});
2 #include "../Numerical/template.cpp"
3 template<class F>
4 int ternSearch(int a, int b, F f) {
5    assert(a <= b);
6    while (b - a >= 5) {
7        int mid = (a + b) / 2;
8        if (f(mid) < f(mid+1)) a = mid; // (A)
9        else b = mid+1;
10   }
11   rep(i,a+1,b+1) if (f(a) < f(i)) a = i; // (B)
12   return a;
13 }
```

3.8 Other Data Structures

3.8.1 Disjoint set (i.e. union-find)

```
1 template <typename T>
2 class DisjointSet {
3    typedef T * iterator;
4    T *parent, n, *rank;
5    public:
6        // O(n), assumes nodes are [0, n)
7        DisjointSet(T n) {
8            this->parent = new T[n];
9            this->n = n;
10           this->rank = new T[n];
11           for (T i = 0; i < n; i++) {
12               parent[i] = i;
13               rank[i] = 0;
14           }
15       }
16
17       // O(log n)
18       T find_set(T x) {
19           if (x == parent[x]) return x;
20           return parent[x] = find_set(parent[x
              ]);
21       }
22
23       // O(log n)
24       void union_sets(T x, T y) {
25           x = this->find_set(x);
26           y = this->find_set(y);
```

```cpp
27
28        if (x == y) return;
29        if (rank[x] < rank[y]) {
30            T z = x;
31            x = y;
32            y = z;
33        }
34        parent[y] = x;
35        if (rank[x] == rank[y]) rank[x]++;
36    }
37 };
```

3.8.2 Fenwick tree (i.e. BIT) eff. update + prefix sum calc. Can be generalized to arbitrary dimensions by duplicating loops.

```cpp
1 // #include "header.h"
2 template < class T >
3 struct FenwickTree { // use 1 based indices !!!
4     int n ; vector <T > tree ;
5     FenwickTree ( int n ) : n ( n ) { tree .
           assign ( n + 1 , 0) ; }
6     T query ( int l , int r ) { return query ( r
           ) - query ( l - 1) ; }
7     T query ( int r ) {
8         T s = 0;
9         for (; r > 0; r -= ( r & ( - r ) ) ) s +=
              tree [ r ];
10        return s ;
11    }
12    void update ( int i , T v ) {
13        for (; i <= n ; i += ( i & ( - i ) ) )
              tree [ i ] += v ;
14    }
15 };
```

3.8.3 Trie

```cpp
1 #include "header.h"
2 const int ALPHABET_SIZE = 26;
3 inline int mp(char c) { return c - 'a'; }
4 struct Node {
5   Node* ch[ALPHABET_SIZE];
6   bool isleaf = false;
7   Node() {

        i].rc].t);
31  }
32 };
```

3.8.8 Suffix tree

```cpp
1 #include "../header.h"
2 using T = char;
3 using M = map<T,int>; // or array<T,ALPHABET_SIZE
     >
4 using V = string; // could be vector<T> as well
5 using It = V::const_iterator;
6 struct Node{
7   It b, e; M edges; int link; // end is exclusive
8   Node(It b, It e) : b(b), e(e), link(-1) {}
9   int size() const { return e-b; }
10 };
11 struct SuffixTree{
12  const V &s; vector<Node> t;
13  int root,n,len,remainder,llink; It edge;
14  SuffixTree(const V &s) : s(s) { build(); }
15  int add_node(It b, It e){ return t.push_back({b
        ,e}), t.size()-1; }
16  int add_node(It b){ return add_node(b,s.end());
        }
17  void link(int node){ if(llink) t[llink].link =
        node; llink = node; }
18  void build(){
19    len = remainder =  0; edge = s.begin();
20    n = root = add_node(s.begin(), s.begin());
21    for(auto i = s.begin(); i != s.end(); ++i){
22    ++remainder; llink = 0;
23    while(remainder){
24      if(len == 0) edge = i;
25      if(t[n].edges[*edge] == 0){
26        t[n].edges[*edge] = add_node(i); link(n
            );
27      } else {
28        auto x = t[n].edges[*edge];
29        if(len >= t[x].size()){
30          len -= t[x].size(); edge += t[x].size
              (); n = x;
31          continue;
32        }
33        if(*(t[x].b + len) == *i){
34          ++len; link(n); break;
35        }
36        auto split = add_node(t[x].b, t[x].b+
            len);
37        t[n].edges[*edge] = split;
38        t[x].b += len;
39        t[split].edges[*i] = add_node(i);
40        t[split].edges[*t[x].b] = x;
41        link(split);
42      }
43      --remainder;
44      if(n == root && len > 0)
45        --len, edge = i - remainder + 1;
46      else n = t[n].link > 0? t[n].link: root;
47    }
48  }
```

```
49      }
50  };
```

3.8.9   UnionFind

```cpp
#include "header.h"
struct UnionFind {
  std::vector<int> par, rank, size;
  int c;
  UnionFind(int n) : par(n), rank(n, 0), size(n,
      1), c(n) {
    for(int i = 0; i < n; ++i) par[i] = i;
  }
  int find(int i) { return (par[i] == i ? i : (
      par[i] = find(par[i]))); }
  bool same(int i, int j) { return find(i) ==
      find(j); }
  int get_size(int i) { return size[find(i)]; }
  int count() { return c; }
  int merge(int i, int j) {
    if((i = find(i)) == (j = find(j))) return -1;
    --c;
    if(rank[i] > rank[j]) swap(i, j);
    par[i] = j;
    size[j] += size[i];
    if(rank[i] == rank[j]) rank[j]++;
    return j;
  }
};
```

3.8.10   Indexed set
Similar to set, but allows accessing elements by index using `find_by_order()` in $O(\log n)$

```cpp
#include "../header.h"
#include <ext/pb_ds/assoc_container.hpp>
using namespace __gnu_pbds;
using namespace std;
typedef tree<int,null_type,less<int>,rb_tree_tag,
    tree_order_statistics_node_update>
    indexed_set;
```

4   Other Mathematics

4.1   Helpful functions

4.1.1   Euler's Totient Fucntion
$n = p_1^{k_1 - 1} \cdot (p_1 - 1) \cdot \ldots \cdot p_r^{k_r - 1} \cdot (p_r - 1)$, where $p_1^{k_1} \cdot \ldots \cdot p_r^{k_r}$ is the prime factorization of n.

```cpp
# include "header.h"
ll phi(ll n) {  // \Phi(n)
    ll ans = 1;
    for (ll i = 2; i*i <= n; i++) {
        if (n % i == 0) {
            ans *= i-1;
            n /= i;
            while (n % i == 0) {
                ans *= i;
                n /= i;
            }
        }
    }
    if (n > 1) ans *= n-1;
    return ans;
}
vi phis(int n) {  // All \Phi(i) up to n
  vi phi(n + 1, 0LL);
  iota(phi.begin(), phi.end(), 0LL);
  for (ll i = 2LL; i <= n; ++i)
    if (phi[i] == i)
      for (ll j = i; j <= n; j += i)
        phi[j] -= phi[j] / i;
  return phi;
}
```

4.1.2   Totient (again but .py)

```python
def totatives(n):
    if n == 1:
        return 1
    phi = int(n > 1 and n)
    for p in range(2, int(n ** .5) + 1):
        if not n % p:
            phi -= phi // p
            while not n % p:
                n //= p
    #if n is > 1 it means it is prime
    if n > 1: phi -= phi // n
    return phi
```

Formulas $\Phi(n)$ counts all numbers in $1, \ldots, n-1$ coprime to n.
$a^{\varphi(n)} \equiv 1 \mod n$, a and n are coprimes.
$\forall e > \log_2 m: \ n^e \mod m = n^{\Phi(m) + e \mod \Phi(m)} \mod m$.
$\gcd(m, n) = 1 \Rightarrow \Phi(m \cdot n) = \Phi(m) \cdot \Phi(n)$.

4.1.3   Pascal's trinagle
$\binom{n}{k}$ is k-th element in the n-th row, indexing both from 0

```cpp
#include "header.h"
void printPascal(int n) {
    for (int line = 1; line <= n; line++) {
        int C = 1; // used to represent C(line, i
            )
        for (int i = 1; i <= line; i++) {
            cout << C << "␣";
            C = C * (line - i) / i;
        }
        cout << "\n";
    }
}
```

4.2   Theorems and definitions

Subfactorial (Derangements)   Permutations of a set such that none of the elements appear in their original position:

$$!n = n! \sum_{i=0}^{n} \frac{(-1)^i}{i!}$$

$$!(0) = 1, \ !n = n \cdot !(n-1) + (-1)^n$$

$$!n = (n-1)(!(n-1) + !(n-2)) = \left[\frac{n!}{e} \right] \tag{1}$$

$$!n = 1 - e^{-1}, \ n \to \infty \tag{2}$$

Binomials and other partitionings

$$\binom{n}{k} = \binom{n-1}{k} + \binom{n-1}{k-1} = \prod_{i=1}^{k} \frac{n-i+1}{i}$$

This last product may be computed incrementally since any product of k' consecutive values is divisibleby $k'!$.
Basic identities: The hockeystick identity:

$$\sum_{k=r}^{n} \binom{k}{r} = \binom{n+1}{r+1}$$

or

$$\sum_{k \le n} \binom{r+k}{k} = \binom{r+n+1}{n}$$

Also

$$\sum_{k=0}^{n} \binom{k}{m} = \binom{n+1}{m+1}$$

$$\sum_{i=0}^{n}\binom{n}{i}=2^n$$

For $n, m \geq 0$ and p prime: write n, m in base p, i.e. $n = n_k p^k + \cdots + n_1 p + n_0$ and $m = m_k p^k + \ldots m_1 p + m_0$. Then by Lucas theorem we have $\binom{n}{m} \equiv \prod_{i=0}^{k}\binom{n_i}{m_i} \mod p$, with the convention that $n_i < m_i \implies \binom{n_i}{m_i} = 0$.

Fibonacci (See also number theory section)

$$\sum_{0 \leq k \leq n}\binom{n-k}{k} = F_{n+1}$$

$$F_n = \frac{1}{\sqrt{5}}\left(\frac{1+\sqrt{5}}{2}\right)^n - \frac{1}{\sqrt{5}}\left(\frac{1-\sqrt{5}}{2}\right)^n$$

$\sum_{i=1}^{n} F_i = F_{n+2} - 1$, $\sum_{i=1}^{n} F_i^2 = F_n F_{n+1}$

$$\gcd(F_m, F_n) = F_{\gcd(m,n)}$$

$$\gcd(F_n, F_{n+1}) = \gcd(F_n, F_{n+2}) = 1$$

Bit stuff $a + b = a \oplus b + 2(a\&b) = a|b + a\&b$.
kth bit is set in x iff $x \mod 2^{k-1} \geq 2^k$, or iff $x \mod 2^{k-1} - x \mod 2^k \neq 0$ (i.e. $= 2^k$) It comes handy when you need to look at the bits of the numbers which are pair sums or subset sums etc.
$n \mod 2^i = n\&(2^i - 1)$.
$\forall k : 1 \oplus 2 \oplus \ldots \oplus (4k-1) = 0$

4.3 Geometry Formulas

Euler: $\qquad 1 + CC = V - E + F$

Pick: $\qquad \text{Area} = \text{itr pts} + \dfrac{\text{bdry pts}}{2} - 1$

Given a non-self-intersecting closed polygon on n vertices, given as (x_i, y_i), its centroid (C_x, C_y) is given as:

$$C_x = \frac{1}{6A}\sum_{i=0}^{n-1}(x_i + x_{i+1})(x_i y_{i+1} - x_{i+1} y_i),$$

$$C_y = \frac{1}{6A}\sum_{i=0}^{n-1}(y_i + y_{i+1})(x_i y_{i+1} - x_{i+1} y_i)$$

$$A = \frac{1}{2}\sum_{i=0}^{n-1}(x_i y_{i+1} - x_{i+1} y_i) = \text{polygon area}$$

Inclusion-Exclusion For appropriate f compute $\sum_{S \subseteq T}(-1)^{|T \setminus S|} f(S)$, or if only the size of S matters, $\sum_{s=0}^{n}(-1)^{n-s}\binom{n}{s} f(s)$. In some contexts we might use Stirling numbers, not binomial coefficients!
Some useful applications:

Graph coloring Let $I(S)$ count the number of independent sets contained in $S \subseteq V$ ($I(\emptyset) = 1$, $I(S) = I(S \setminus v) + I(S \setminus N(v))$). Let $c_k = \sum_{S \subseteq V}(-1)^{|V \setminus S|} I(S)$. Then V is k-colorable iff $v > 0$. Thus we can compute the chromatic number of a graph in $O^*(2^n)$ time.

Burnside's lemma Given a group G acting on a set X, the number of elements in X up to symmetry is

$$\frac{1}{|G|}\sum_{g \in G}|X^g|$$

with X^g the elements of X invariant under g. For example, if $f(n)$ counts "configurations" of some sort of length n, and we want to count them up to rotational symmetry using $G = \mathbb{Z}/n\mathbb{Z}$, then

$$g(n) = \frac{1}{n}\sum_{k=0}^{n-1}f(\gcd(n,k)) = \frac{1}{n}\sum_{k\|n}f(k)\phi(n/k)$$

I.e. for coloring with c colors we have $f(k) = k^c$.
Relatedly, in Pólya's enumeration theorem we imagine X as a set of n beads with G permuting the beads (e.g. a necklace, with G all rotations and reflections of the n-cycle, i.e. the dihedral group D_n). Suppose further that we had Y colors, then the number of G-invariant colorings Y^X/G is counted by

$$\frac{1}{|G|}\sum_{g \in G}|Y|^{c(g)}$$

with $c(g)$ counting the number of cycles of g when viewed as a permutation of X. We can generalize this to a weighted version: if the color i can occur exactly r_i times, then this is counted by the coefficient of $t_1^{r_1}\ldots t_n^{r_n}$ in the polynomial

$$Z(t_1, \ldots, t_n) = \frac{1}{|G|}\sum_{g \in G}\prod_{m \geq 1}(t_1^m + \cdots + t_n^m)^{c_m(g)}$$

where $c_m(g)$ counts the number of length m cycles in g acting as a permutation on X. Note we get the original formula by setting all $t_i = 1$. Here Z is the cycle index. Note: you can cleverly deal with even/odd sizes by setting some t_i to -1.

Lucas Theorem If p is prime, then:

$$\frac{p^a}{k} \equiv 0(\mod p)$$

Thus for non-negative integers $m = m_k p^k + \ldots + m_1 p + m_0$ and $n = n_k p^k + \ldots + n_1 p + n_0$:

$$\frac{m}{n} = \Pi_{i=0}^{k}\frac{m_i}{n_i} \mod p$$

Note: The fraction's mean integer division.

4.4 Recurrences

If $a_n = c_1 a_{n-1} + \cdots + c_k a_{n-k}$, and $r_1, \ldots, r_k$ are distinct roots of $x^k - c_1 x^{k-1} - \cdots - c_k$, there are $d_1, \ldots, d_k$ s.t.

$$a_n = d_1 r_1^n + \cdots + d_k r_k^n.$$

Non-distinct roots r become polynomial factors, e.g. $a_n = (d_1 n + d_2)r^n$.

4.5 Sums

$$1^3 + 2^3 + 3^3 + \cdots + n^3 = \frac{n^2(n+1)^2}{4}$$

$$1^4 + 2^4 + 3^4 + \cdots + n^4 = \frac{n(n+1)(2n+1)(3n^2+3n-1)}{30}$$

4.6 Series

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots, \ (-\infty < x < \infty)$$

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots, \ (-1 < x \le 1)$$

$$\sqrt{1+x} = 1 + \frac{x}{2} - \frac{x^2}{8} + \frac{2x^3}{32} - \frac{5x^4}{128} + \dots, \ (-1 \le x \le 1)$$

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \dots, \ (-\infty < x < \infty)$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \dots, \ (-\infty < x < \infty)$$

4.7 Quadrilaterals

With side lengths a, b, c, d, diagonals e, f, diagonals angle θ, area A and magic flux $F = b^2 + d^2 - a^2 - c^2$:

$$4A = 2ef \cdot \sin\theta = F\tan\theta = \sqrt{4e^2f^2 - F^2}$$

For cyclic quadrilaterals the sum of opposite angles is $180°$, $ef = ac + bd$, and $A = \sqrt{(p-a)(p-b)(p-c)(p-d)}$.

4.8 Triangles

Side lengths: a, b, c

Semiperimeter: $p = \dfrac{a+b+c}{2}$

Area:

$$[ABC] = rp = \frac{1}{2}ab\sin\gamma$$

$$= \frac{abc}{4R} = \sqrt{p(p-a)(p-b)(p-c)} = \frac{1}{2}\left|(B-A, C-A)^T\right|$$

Circumradius: $R = \dfrac{abc}{4A}$, Inradius: $r = \dfrac{A}{p}$

Length of median (divides triangle into two equal-area triangles): $m_a = \frac{1}{2}\sqrt{2b^2 + 2c^2 - a^2}$

Length of bisector (divides angles in two): $s_a = \sqrt{bc\left[1 - \left(\dfrac{a}{b+c}\right)^2\right]}$

Law of tangents: $\dfrac{a+b}{a-b} = \dfrac{\tan\dfrac{\alpha+\beta}{2}}{\tan\dfrac{\alpha-\beta}{2}}$

4.9 Trigonometry

$$\tan(v+w) = \frac{\tan v + \tan w}{1 - \tan v \tan w}$$

$$\sin v + \sin w = 2\sin\frac{v+w}{2}\cos\frac{v-w}{2}$$

$$\cos v + \cos w = 2\cos\frac{v+w}{2}\cos\frac{v-w}{2}$$

$$(V+W)\tan(v-w)/2 = (V-W)\tan(v+w)/2$$

where V, W are lengths of sides opposite angles v, w.

$$a\cos x + b\sin x = r\cos(x - \phi)$$
$$a\sin x + b\cos x = r\sin(x + \phi)$$

where $r = \sqrt{a^2 + b^2}, \phi = \text{atan2}(b, a)$.

4.10 Combinatorics

Combinations and Permutations
$P(n, r) = \frac{n!}{(n-r)!}$
$C(n, r) = \binom{n}{r} = \frac{n!}{r!(n-r)!}$
$C(n, r) = C(n, n-r)$

4.11 Cycles

Let $g_S(n)$ be the number of n-permutations whose cycle lengths all belong to the set S. Then

$$\sum_{n=0}^{\infty} g_S(n)\frac{x^n}{n!} = \exp\left(\sum_{n\in S}\frac{x^n}{n}\right)$$

4.12 Labeled unrooted trees

\# on n vertices: n^{n-2}
\# on k existing trees of size n_i: $n_1 n_2 \cdots n_k n^{k-2}$
\# with degrees d_i: $(n-2)!/((d_1-1)!\cdots(d_n-1)!)$

4.13 Partition function

Number of ways of writing n as a sum of positive integers, disregarding the order of the summands.

$$p(0) = 1, \ p(n) = \sum_{k\in\mathbb{Z}\setminus\{0\}} (-1)^{k+1} p(n - k(3k-1)/2)$$

$$p(n) \sim 0.145/n \cdot \exp(2.56\sqrt{n})$$

n	0	1	2	3	4	5	6	7	8	9	20	50	100
$p(n)$	1	1	2	3	5	7	11	15	22	30	627	$\sim$2e5	$\sim$2e8

4.14 Numbers

Bernoulli numbers EGF of Bernoulli numbers is $B(t) = \frac{t}{e^t - 1}$ (FFT-able). $B[0,\dots] = [1, -\frac{1}{2}, \frac{1}{6}, 0, -\frac{1}{30}, 0, \frac{1}{42}, \dots]$
Sums of powers:

$$\sum_{i=1}^{n} n^m = \frac{1}{m+1}\sum_{k=0}^{m}\binom{m+1}{k}B_k \cdot (n+1)^{m+1-k}$$

Euler-Maclaurin formula for infinite sums:

$$\sum_{i=m}^{\infty} f(i) = \int_m^{\infty} f(x)dx - \sum_{k=1}^{\infty}\frac{B_k}{k!}f^{(k-1)}(m)$$

$$\approx \int_m^{\infty} f(x)dx + \frac{f(m)}{2} - \frac{f'(m)}{12} + \frac{f'''(m)}{720} + O(f^{(5)}(m))$$

Stirling's numbers First kind: $S_1(n, k)$ count permutations on n items with k cycles. $S_1(n, k) = S_1(n-1, k-1) + (n-1)S_1(n-1, k)$ with $S_1(0, 0) = 1$. Note:

$$\sum_{k=0}^{n} S_1(n, k)x^k = x(x+1)\dots(x+n-1)$$

$$\sum_{k=0}^{n} S_1(n, k) = n!$$

$S_1(8, k) = 8, 0, 5040, 13068, 13132, 6769, 1960, 322, 28, 1$
$S_1(n, 2) = 0, 0, 1, 3, 11, 50, 274, 1764, 13068, 109584, \dots$
Second kind: $S_2(n, k)$ count partitions of n distinct elements into exactly k non-empty groups.

$$S_2(n, k) = S_2(n-1, k-1) + kS_2(n-1, k)$$

$$S_2(n, 1) = S_2(n, n) = 1$$

$$S_2(n, k) = \frac{1}{k!}\sum_{i=0}^{k}(-1)^{k-i}\binom{k}{i}i^n$$

Catalan Numbers - Number of correct bracket sequence consisting of n opening and n closing brackets.

The number of ways to completely parenthesize $n + 1$ factors.

The number of triangulations of a convex polygon with $n + 2$ sides (i.e. the number of partitions of polygon into disjoint triangles by using the diagonals).

The number of ways to connect the $2n$ points on a circle to form n disjoint i.e. non-intersecting chords.

$$C_n = \frac{1}{n+1}\binom{2n}{n}$$

$$C_0 = 1, \ C_1 = 1, \ C_n = \sum_{k=0}^{n-1} C_k C_{n-1-k}$$

Narayana numbers The number of expressions containing n pairs of parentheses, which are correctly matched and which contain k distinct nestings.

$$N(n,k) = \frac{1}{n}\frac{n}{k}\frac{n}{k-1}$$

Eulerian numbers Number of permutations $\pi \in S_n$ in which exactly k elements are greater than the previous element. k j:s s.t. $\pi(j) > \pi(j+1)$, $k+1$ j:s s.t. $\pi(j) \geq j$, k j:s s.t. $\pi(j) > j$.

$$E(n,k) = (n-k)E(n-1,k-1) + (k+1)E(n-1,k)$$

$$E(n,0) = E(n,n-1) = 1$$

$$E(n,k) = \sum_{j=0}^{k}(-1)^j\binom{n+1}{j}(k+1-j)^n$$

Bell numbers Total number of partitions of n distinct elements. $B(n) = 1, 1, 2, 5, 15, 52, 203, 877, 4140, 21147, \ldots$. For p prime,

$$B(p^m + n) \equiv mB(n) + B(n+1) \pmod{p}$$

Catalan numbers

$$C_n = \frac{1}{n+1}\binom{2n}{n} = \binom{2n}{n} - \binom{2n}{n+1} = \frac{(2n)!}{(n+1)!n!}$$

$$C_0 = 1, \ C_{n+1} = \frac{2(2n+1)}{n+2}C_n, \ C_{n+1} = \sum C_i C_{n-i}$$

$$C_n = 1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, 16796, 58786, \ldots$$

- sub-diagonal monotone paths in an $n \times n$ grid.
- strings with n pairs of parenthesis, correctly nested.
- binary trees with with $n + 1$ leaves (0 or 2 children).
- ordered trees with $n + 1$ vertices.
- ways a convex polygon with $n+2$ sides can be cut into triangles by connecting vertices with straight lines.
- permutations of $[n]$ with no 3-term increasing subseq.

4.15 Probability

Stochastic variables
$$P(X = r) = C(n,r) \cdot p^r \cdot (1-p)^{n-r}$$

Bayes' Theorem $P(B|A) = \frac{P(A|B)P(B)}{P(A)}$

$$P(B|A) = \frac{P(A|B)P(B)}{P(A|B)P(B)+P(A|\bar{B})P(\bar{B})}$$

$$P(B_k|A) = \frac{P(A|B_k)P(B_k)}{P(A|B_1)P(B_1)\cdot\ldots\cdot P(A|B_n)P(B_n)}$$

Expectation Let X be a discrete random variable with probability $p_X(x)$ of assuming the value x. It will then have an expected value (mean) $\mu = \mathbb{E}(X) = \sum_x x p_X(x)$ and variance $\sigma^2 = V(X) = \mathbb{E}(X^2) - (\mathbb{E}(X))^2 = \sum_x (x - \mathbb{E}(X))^2 p_X(x)$ where σ is the standard deviation. If X is instead continuous it will have a probability density function $f_X(x)$ and the sums above will instead be integrals with $p_X(x)$ replaced by $f_X(x)$.

Expectation is linear:

$$\mathbb{E}(aX + bY) = a\mathbb{E}(X) + b\mathbb{E}(Y)$$

For independent X and Y,

$$V(aX + bY) = a^2 V(X) + b^2 V(Y).$$

4.16 Number Theory

Bezout's Theorem

$$a, b \in \mathbb{Z}^+ \implies \exists s, t \in \mathbb{Z} : \gcd(a,b) = sa + tb$$

Bézout's identity For $a \neq$, $b \neq 0$, then $d = gcd(a,b)$ is the smallest positive integer for which there are integer solutions to
$$ax + by = d$$

If (x, y) is one solution, then all solutions are given by

$$\left(x + \frac{kb}{\gcd(a,b)}, y - \frac{ka}{\gcd(a,b)}\right), \quad k \in \mathbb{Z}$$

Partial Coprime Divisor Property

$$(\gcd(a,b) = 1) \wedge (a \mid bc) \implies (a \mid c)$$

Coprime Modulus Equivalence Property

$$(\gcd(c,m) = 1) \wedge (ac \equiv bc \mod m) \implies (a \equiv b \mod m)$$

Fermat's Little Theorem

$$(\text{prime}(p)) \wedge (p \nmid a) \implies (a^{p-1} \equiv 1 \mod p)$$

$$(\text{prime}(p)) \implies (a^p \equiv a \mod p)$$

Pythagorean Triples The Pythagorean triples are uniquely generated by

$$a = k \cdot (m^2 - n^2), \ b = k \cdot (2mn), \ c = k \cdot (m^2 + n^2),$$

with $m > n > 0$, $k > 0$, $m \perp n$, and either m or n even.

Primes $p = 962592769$ is such that $2^{21} \mid p - 1$, which may be useful. For hashing use 970592641 (31-bit number), 31443539979727 (45-bit), 3006703054056749 (52-bit). There are 78498 primes less than $1\,000\,000$.

Primitive roots exist modulo any prime power p^a, except for $p = 2, a > 2$, and there are $\phi(\phi(p^a))$ many. For $p = 2, a > 2$, the group $\mathbb{Z}_{2^a}^\times$ is instead isomorphic to $\mathbb{Z}_2 \times \mathbb{Z}_{2^{a-2}}$.

Estimates $\sum_{d|n} d = O(n \log \log n)$.

The number of divisors of n is at most around 100 for $n < 5e4$, 500 for $n < 1e7$, 2000 for $n < 1e10$, 200 000 for $n < 1e19$.

Mobius Function

$$\mu(n) = \begin{cases} 0 & n \text{ is not square free} \\ 1 & n \text{ has even number of prime factors} \\ -1 & n \text{ has odd number of prime factors} \end{cases}$$

Mobius Inversion:

$$g(n) = \sum_{d|n} f(d) \Leftrightarrow f(n) = \sum_{d|n} \mu(d)g(n/d)$$

Other useful formulas/forms:

$\sum_{d|n} \mu(d) = [n = 1]$ (very useful)

$g(n) = \sum_{n|d} f(d) \Leftrightarrow f(n) = \sum_{n|d} \mu(d/n)g(d)$

$g(n) = \sum_{1 \le m \le n} f(\lfloor \frac{n}{m} \rfloor) \Leftrightarrow f(n) = \sum_{1 \le m \le n} \mu(m)g(\lfloor \frac{n}{m} \rfloor)$

4.17 Discrete distributions

Binomial distribution The number of successes in n independent yes/no experiments, each which yields success with probability p is $\text{Bin}(n, p)$, $n = 1, 2, \ldots, 0 \le p \le 1$.

$$p(k) = \binom{n}{k} p^k (1-p)^{n-k}$$

$$\mu = np, \ \sigma^2 = np(1-p)$$

$\text{Bin}(n, p)$ is approximately $\text{Po}(np)$ for small p.

First success distribution The number of trials needed to get the first success in independent yes/no experiments, each wich yields success with probability p is $\text{Fs}(p)$, $0 \le p \le 1$.

$$p(k) = p(1-p)^{k-1}, \ k = 1, 2, \ldots$$

$$\mu = \frac{1}{p}, \ \sigma^2 = \frac{1-p}{p^2}$$

Poisson distribution The number of events occurring in a fixed period of time t if these events occur with a known average rate κ and independently of the time since the last event is $\text{Po}(\lambda)$, $\lambda = t\kappa$.

$$p(k) = e^{-\lambda} \frac{\lambda^k}{k!}, k = 0, 1, 2, \ldots$$

$$\mu = \lambda, \ \sigma^2 = \lambda$$

4.18 Continuous distributions

Uniform distribution If the probability density function is constant between a and b and 0 elsewhere it is $\text{U}(a, b)$, $a < b$.

$$f(x) = \begin{cases} \frac{1}{b-a} & a < x < b \\ 0 & \text{otherwise} \end{cases}$$

$$\mu = \frac{a+b}{2}, \ \sigma^2 = \frac{(b-a)^2}{12}$$

Exponential distribution The time between events in a Poisson process is $\text{Exp}(\lambda)$, $\lambda > 0$.

$$f(x) = \begin{cases} \lambda e^{-\lambda x} & x \ge 0 \\ 0 & x < 0 \end{cases}$$

$$\mu = \frac{1}{\lambda}, \ \sigma^2 = \frac{1}{\lambda^2}$$

Normal distribution Most real random values with mean μ and variance σ^2 are well described by $\mathcal{N}(\mu, \sigma^2)$, $\sigma > 0$.

$$f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$$

If $X_1 \sim \mathcal{N}(\mu_1, \sigma_1^2)$ and $X_2 \sim \mathcal{N}(\mu_2, \sigma_2^2)$ then

$$aX_1 + bX_2 + c \sim \mathcal{N}(\mu_1 + \mu_2 + c, a^2\sigma_1^2 + b^2\sigma_2^2)$$
